Graphing

A collection of versatile graphing tools plus a large 79 × 47-dot display makes it easy to draw a variety of function graphs quickly and easily. This calculator is capable of drawing the following types of graphs.

- Rectangular coordinate (Y =) graphs
- Parametric graphs
- Inequality graphs

- A selection of graph commands also makes it possible to incorporate graphing into programs.

1. Before Trying to Draw a Graph
2. View Window (V-Window) Settings
3. Graph Function Operations
4. Drawing Graphs Manually
5. Other Graphing Functions
1. Before Trying to Draw a Graph

■ Entering the Graph Mode

On the Main Menu, select the GRAPH icon and enter the GRAPH Mode. When you do, the Graph Function (G-Func) menu appears on the display. You can use this menu to store, edit, and recall functions and to draw their graphs.

Memory area

Use ← and → to change selection.

F1 (SEL) .......... Draw/non-draw status
F2 (DEL) ........ Graph delete
F4 (DRAW) .... Draws graph

2. View Window (V-Window) Settings

Use the View Window to specify the range of the x- and y-axes, and to set the spacing between the increments on each axis. You should always set the View Window parameters you want to use before drawing a graph. Press [SHIFT] [F3] to display the View Window.

1. Press [SHIFT] [F3] to display the View Window.

F1 (INIT) .......... View Window initial settings
F2 (TRIG) ........ View Window initial settings using specified angle unit
F3 (Sto) .......... Store View Window settings to View Window memory.
F4 (Rcl) .......... Recall View Window settings from View Window memory.

Xmin ............... Minimum x-axis value
Xmax ............... Maximum x-axis value
Xscl ............... Spacing of x-axis increments
2. Input a value for a parameter and press \[ \text{Ex}. \] The calculator automatically selects the next parameter for input.

- You can also select a parameter using the \([\text{\downarrow}]\) and \([\text{\uparrow}]\) keys.

![U-Window]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ymin</td>
<td>Minimum ( y )-axis value</td>
</tr>
<tr>
<td>Ymax</td>
<td>Maximum ( y )-axis value</td>
</tr>
<tr>
<td>Yscl</td>
<td>Spacing of ( y )-axis increments</td>
</tr>
</tbody>
</table>

The following illustration shows the meaning of each of these parameters.

3. Input a value for a parameter and press \[ \text{Ex}. \] The calculator automatically selects the next parameter for input.

- There are actually nine View Window parameters. The remaining three parameters appear on the display when you move the highlighting down past the \( Y \) scale parameter by inputting values and pressing \([\text{\downarrow}]\).

![U-Window]

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tmin</td>
<td>( T ) minimum values</td>
</tr>
<tr>
<td>Tmax</td>
<td>( T ) maximum values</td>
</tr>
<tr>
<td>Tptch</td>
<td>( T ) pitch</td>
</tr>
</tbody>
</table>

The following illustration shows the meaning of each of these parameters.
4. To exit the View Window, press **[QUIT]**.
- Pressing **[EXE]** without inputting any value also exits the View Window.
- The following is the input range for View Window parameters.
  $$-9.99E+97 \text{ to } 9.999E+97$$
- You can input parameter values up to 7 digits long. Values greater than $$10^6$$ or less than $$10^{-1}$$, are automatically converted to a 4-digit mantissa (including negative sign) plus a 2-digit exponent.
- The only keys that enabled while the View Window is on the display are: **[0]** to **[9]**, **[EXP]**, **[(-)]**, **[π]**, **[(±)]**, **[(±)]**, **[+]**, **[-]**, **[*]**, **[/]**, **[(±)]**, **[(±)]**. You can use **[(-)]** or **[(-)]** to input negative values.
- The existing value remains unchanged if you input a value outside the allowable range or in the case of illegal input (negative sign only without a value).
- Inputting a View Window range so the min value is greater than the max value, causes the axis to be inverted.
- You can input expressions (such as $$2\pi$$) as View Window parameters.
- When the View Window setting does not allow display of the axes, the scale for the $$y$$-axis is indicated on either the left or right edge of the display, while that for the $$x$$-axis is indicated on either the top or bottom edge.
- When View Window values are changed, the graph display is cleared and the newly set axes only are displayed.
- View Window setting may cause irregular scale spacing.
- Setting maximum and minimum values that create too wide of a View Window range can result in a graph made up of disconnected lines (because portions of the graph run off the screen), or in graphs that are inaccurate.
- The point of deflection sometimes exceeds the capabilities of the display with graphs that change drastically as they approach the point of deflection.
- Setting maximum and minimum values that create to narrow of a View Window range can result in an error (Ma ERROR).

---

**Initializing and Standardizing the View Window**

**To initialize the View Window**

a. Press **[SHIFT]** **[3]** (V-Window) **[F1]** (INIT) to initialize the View Window to the following settings.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Xmin</td>
<td>$$-3.9$$</td>
</tr>
<tr>
<td>Ymin</td>
<td>$$-2.3$$</td>
</tr>
<tr>
<td>Xmax</td>
<td>$$3.9$$</td>
</tr>
<tr>
<td>Ymax</td>
<td>$$2.3$$</td>
</tr>
<tr>
<td>Xscl</td>
<td>1</td>
</tr>
<tr>
<td>Yscl</td>
<td>1</td>
</tr>
</tbody>
</table>
b. Press \texttt{SHIFT} \texttt{F3} (V-Window) \texttt{F2} (TRIG) to initialize the View Window to the following settings.

\textbf{Deg Mode}

\begin{align*}
X_{\text{min}} &= -360 & Y_{\text{min}} &= -1.6 \\
X_{\text{max}} &= 360 & Y_{\text{max}} &= 1.6 \\
X_{\text{scl}} &= 90 & Y_{\text{scl}} &= 0.5
\end{align*}

\textbf{Rad Mode}

\begin{align*}
X_{\text{min}} &= -6.28318 \\
X_{\text{max}} &= 6.28318 \\
X_{\text{scl}} &= 1.57079
\end{align*}

\textbf{Gra Mode}

\begin{align*}
X_{\text{min}} &= -400 \\
X_{\text{max}} &= 400 \\
X_{\text{scl}} &= 100
\end{align*}

- The settings for $Y_{\text{min}}, Y_{\text{max}}, Y_{\text{pitch}}, T_{\text{min}}, T_{\text{max}},$ and $T_{\text{pitch}}$ remain unchanged when you press \texttt{F2} (TRIG).

\section*{View Window Memory}

You can store a set of View Window settings in View Window memory for recall when you need them.

\textbf{To save View Window settings}

While the View Window setting screen is on the display, press \texttt{F3} (Sto) to save the current settings.

- Whenever you save View Window settings, any settings previously stored in memory are replaced.

\textbf{To recall View Window settings}

While the View Window setting screen is on the display, press \texttt{F4} (Rcl) to recall the View Window settings stored in memory.

- Whenever you recall View Window settings, the settings on the View Window are replaced by the recalled settings.

- You can change View Window settings in a program using the following syntax.

\texttt{View Window} \[\text{Xmin value}, \text{Xmax value}, \text{Xscl value}, \text{Ymin value}, \text{Ymax value}, \text{Yscl value}, \text{Tmin value}, \text{Tmax value}, \text{Tptch value}\]
3. Graph Function Operations

You can store up to 10 functions in memory. Functions in memory can be edited, recalled, and graphed. The types of functions that can be stored in memory are: rectangular coordinate functions, parametric functions, and inequalities.

Specifying the Graph Type

Before you can store a graph function in memory, you must first specify its graph type.

1. While the Graph Function Menu is on the display, press \[ \rightarrow \] to display a Graph Type Menu.

\[ \rightarrow \]

F1 (Y =) ........ Rectangular coordinate graph
F2 (Parm) ...... Parametric graph

Press \[ \rightarrow \] to return to the previous menu

2. Press the function key that corresponds to the graph type you want to specify.

Storing Graph Functions

To store a rectangular coordinate function (Y =)

Example: To store the following expression in memory area Y1:
\[
y = 2x^2 - 5
\]

\[ \rightarrow \] F1 (Y =)
(Specifies rectangular coordinate expression.)
2 X^2 ➥ 5
(Inputs expression.)

(Stores expression.)
• You will not be able to store the expression in an area that already contains a parametric function. Select another area to store your expression or delete the existing parametric function first. This also applies when storing inequalities.

**To store a parametric function**

**Example** To store the following functions in memory areas Xt2 and Yt2:

\[
\begin{align*}
  x &= 3 \sin T \\
  y &= 3 \cos T
\end{align*}
\]

\[\text{(Inputs and stores } x \text{ expression.)}\]

\[\text{(Inputs and stores } y \text{ expression.)}\]

• You will not be able to store the expression in an area that already contains a rectangular coordinate expression or inequality. Select another area to store your expression or delete the existing expression first.

**To store an inequality**

**Example** To store the following inequality in memory area Y3:

\[y > x^2 - 2x - 6\]

\[\text{(Specifies an inequality.)}\]

\[\text{(Inputs expression.)}\]

\[\text{(Stores expression.)}\]
Graphing Chapter 4

■ Editing Functions in Memory

• To edit a function in memory

**Example** To change the expression in memory area Y1 from \( y = 2x^2 - 5 \) to \( y = 2x^2 - 3 \)

(Displays cursor.)

(Changes contents.)

(Stores new graph function.)

• To delete a function

1. While the Graph Function Menu is on the display, press \( \uparrow \) or \( \downarrow \) to display the cursor and move the highlighting to the area that contains the function you want to delete.

2. Press \( \text{F2} \) (DEL).

3. Press \( \text{F1} \) (YES) to delete the function for \( \text{F4} \) (NO) to abort the procedure without deleting anything.

■ Drawing a Graph

Before actually drawing a graph, you should first make the draw/non-draw status.

• To specify the draw/non-draw status of a graph

You can specify which functions out of those stored in memory should be used for a draw operation.

- Graphs for which there is no draw/non-draw status specification are not drawn.

**Example** To select the following functions for drawing:

- \( Y1 : y = 2x^2 - 5 \)
- \( X\#2: x = 3 \sin T \)
- \( Y\#2: y = 3 \cos T \)
Use the following View Window parameters.

\[
\begin{align*}
\text{Xmin} &= -5 & \text{Ymin} &= -5 \\
\text{Xmax} &= 5 & \text{Ymax} &= 5 \\
\text{Xscl} &= 1 & \text{Yscl} &= 1
\end{align*}
\]

(Select a memory area that contains a function for which you want to specify non-draw.)

\[
\begin{align*}
\text{F1} & \text{(SEL)} \\
\text{(Specify non-draw.)}
\end{align*}
\]

\[
\begin{align*}
\text{F4} & \text{(DRAW)} \text{ or } \text{F2} \\
\text{(Draws graphs.)}
\end{align*}
\]

- Pressing \( \text{C} \) or \( \text{AC} \) returns to the Graph Function Menu.
- A parametric graph will appear coarse if the settings you make in the View Window cause the pitch value to be too large, relative to the differential between the min and max settings. If the settings you make cause the pitch value to be too small relative to the differential between the min and max settings, on the other hand, the graph will take a very long time to draw.

### 4. Drawing Graphs Manually

After you select the RUN icon in the Main Menu and enter the RUN Mode, you can draw graphs manually. First press \( \text{SHIFT} \) \( \text{F4} \) (SKTCH) \( \text{F2} \) (GRPH) to recall the Graph Command Menu, and then input the graph function.

\[
\begin{align*}
\text{SHIFT} & \text{F4} \text{(SKTCH)} \text{F2} \text{(GRPH)} \\
\text{F1} & \text{(Y =) .......... Rectangular coordinate graph} \\
\text{F2} & \text{(Parm) .......... Parametric graph}
\end{align*}
\]
Graphing Chapter 4

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| F1 | (Y >) ........ Y > f(x) inequality |
| F2 | (Y <) ........ Y < f(x) inequality |
| F3 | (Y ≥) ........ Y ≥ f(x) inequality |
| F4 | (Y ≤) ........ Y ≤ f(x) inequality |

Press \(\triangleright\) to return to the previous menu.

**To graph using rectangular coordinates \((Y =)\)**

You can graph functions that can be expressed in the format \(y = f(x)\).

**Example**

To graph \(y = 2x^2 + 3x - 4\)

Use the following View Window parameters.

\[
\begin{align*}
X_{\text{min}} &= -5 & Y_{\text{min}} &= -10 \\
X_{\text{max}} &= 5 & Y_{\text{max}} &= 10 \\
X_{\text{scl}} &= 2 & Y_{\text{scl}} &= 5
\end{align*}
\]

1. In the set-up screen, specify the appropriate graph type for F-Type.

\[\text{SHIFT} \ \text{SETUP} \ \text{F1} \ (Y =) \ \text{QUIT}\]

2. Input the rectangular coordinate \((Y =)\) expression.

\[\text{AC} \ \text{SHIFT} \ \text{F4} \ (\text{SKTCH}) \ \text{F1} \ (\text{Cls}) \ \text{EX}\]

\[\text{F2} \ (\text{GRPH}) \ \text{F1} \ (Y =) \]

\[2 \ x^2 + 3 \ x - 4\]

3. Press \(\text{EX}\) to draw the graph.

\[\text{EX}\]

- You can draw graphs of the following built-in scientific functions.

\[
\begin{align*}
\sin x & \quad \cos x & \quad \tan x & \quad \sin^{-1} x & \quad \cos^{-1} x \\
\tan^{-1} x & \quad \sqrt{x} & \quad x^2 & \quad \log x & \quad \ln x \\
10^x & \quad e^x & \quad x^{-1} & \quad \sqrt[3]{x}
\end{align*}
\]

View Window settings are made automatically for built-in graphs.
To graph parametric functions

You can graph parametric functions that can be expressed in the following format.

\((X, Y) = (f(T), g(T))\)

**Example**

To graph the following parametric functions:

\[x = 7 \cos T - 2 \cos 3T\]
\[y = 7 \sin T - 2 \sin 3T\]

Use the following View Window parameters.

\[
\begin{align*}
X_{\text{min}} &= -20 & Y_{\text{min}} &= -12 \\
X_{\text{max}} &= 20 & Y_{\text{max}} &= 12 \\
X_{\text{scl}} &= 5 & Y_{\text{scl}} &= 5 \\
T_{\text{min}} &= 0 & T_{\text{max}} &= 2\pi \\
T_{\text{ptch}} &= \frac{\pi}{36}
\end{align*}
\]

1. In the set-up screen, specify the appropriate graph type for F-Type.

\[\text{SHIFT SETUP F2 (Parm)}\]

2. Set the default angle unit to radians (Rad).

\[\text{y} \downarrow \text{y} \text{F2 (Rad) OUT}\]

3. Input the parametric functions.

\[\text{AC SHIFT F4 (SKTCH) F1 (Cls) EX} \]
\[\text{F2 (GRPH) F2 (Parm)} \]
\[7 \cos T \rightarrow 2 \cos 3T \downarrow \]
\[7 \sin T \rightarrow 2 \sin 3T \downarrow \]

4. Press \[\text{EX} \] to draw the graph.

\[\text{EX}\]

To graph inequalities

You can graph inequalities that can be expressed in the following four formats.

- \(y > f(x)\)
- \(y < f(x)\)
- \(y \geq f(x)\)
- \(y \leq f(x)\)
Example: To graph the inequality \( y > x^2 - 2x - 6 \)

Use the following View Window parameters.

\[
\begin{align*}
X_{\text{min}} &= -6 & Y_{\text{min}} &= -10 \\
X_{\text{max}} &= 6 & Y_{\text{max}} &= 10 \\
X_{\text{scl}} &= 1 & Y_{\text{scl}} &= 5
\end{align*}
\]

1. In the set-up screen, specify the appropriate graph type for F-Type.

\[\text{SHIFT} \ \text{SETUP} \ \text{F1 (Y>) OUT}\]

2. Input the inequality.

\[\text{AC \ SHIFT} \ \text{F4 (SKTCH)} \ \text{F1 (Cls)} \ \text{EXE}\]

\[\text{F2 (GRPH) \rightarrow F1 (Y>)}\]

\[\text{LT1} \ \text{x}^2 - \text{Z} \ \text{LT1} \rightarrow 6\]

3. Press \text{EXE} to draw the graph.

\[\text{EXE}\]

5. Other Graphing Functions

The functions described in this section tell you how to read the \( x \)- and \( y \)-coordinates at a given point, and how to zoom in and zoom out on a graph.

- These functions can be used with rectangular coordinate, parametric, and inequality graphs only.

**Connect Type and Plot Type Graphs (D-Type)**

You can use the D-Type setting of the set-up screen to specify one of two graph types.

- Connect type (Conct)
  - Points are plotted and connected by lines to create a curve.
- Plot
  - Points are plotted without being connected.
Trace

With trace, you can move a flashing pointer along a graph with the †, ‡, •, and ‣ cursor keys and obtain readouts of coordinates at each point. The following shows the different types of coordinate readouts produced by trace.

- Rectangular Coordinate Graph
  \[ x = -1.923 \quad y = 2.3964 \]
- Parametric Function Graph
  \[ T = 0.9599 \quad X = 5.9468 \quad Y = 5.2164 \]
- Inequality Graph
  \[ x = 4.153 \quad y > 19.562 \]

To use trace to read coordinates

**Example**  To determine the points of intersection for graphs produced by the following functions:

\[ Y_1: y = x^2 - 3 \]
\[ Y_2: y = -x + 2 \]

Use the following View Window parameters.

\[ X_{\text{min}} = -5 \quad Y_{\text{min}} = -10 \]
\[ X_{\text{max}} = 5 \quad Y_{\text{max}} = 10 \]
\[ X_{\text{scl}} = 1 \quad Y_{\text{scl}} = 2 \]

1. After drawing the graphs, press \( \boxed{\text{F1}} \) (TRCE) to make the pointer appear at the far left of the graph.

\( \boxed{\text{F1}} \) (TRCE)

- The pointer may not be visible on the graph when you press \( \boxed{\text{F1}} \) (TRCE).

2. Use \( \text{\textless} \) to move the pointer to the first intersection.
• Pressing ◄ and ► moves the pointer along the graph. Holding down either key moves the pointer at high speed.

3. Use ◄ and ► to move the pointer between the two graphs.
4. Use ◄ to move the pointer to the other intersection.

• To quit the trace operation, press F1 (TRCE) again.

**Scrolling**

When the graph you are tracing runs off the display along either the x- or y-axis, pressing the ◄ or ► cursor key causes the screen to scroll in the corresponding direction eight dots.

• You can scroll only rectangular coordinate and inequality graphs while tracing. You cannot scroll parametric function graphs.

• Trace can be used only immediately after a graph is drawn. It cannot be used after changing the settings of a graph.
• You cannot incorporate trace into a program.
• You can use trace on a graph that was drawn as the result of an output command (▼), which is indicated by the “-Disp-” indicator on the screen.

**Scroll**

You can scroll a graph along its x- or y-axis. Each time you press ◄, ◄, ◄, or ◄, the graph scrolls 12 dots in the corresponding direction.

**Overwrite**

Using the following syntax to input a graph causes multiple versions of the graph to be drawn using the specified values. All versions of the graph appear on the display at the same time.

```
<function with one variable> ◄ ◄ ◄ <variable name> ◄ ◄ ◄ <value> ◄ ◄ ◄ <value> ◄ ◄ ◄ .... <value> ◄ ◄ ◄ ◄ ◄ EXIT
```
Example

To graph \( y = Ax^2 - 3 \), substituting 3, 1, and –1 for the value of A

Use the following View Window parameters.

\[
\begin{align*}
X_{\text{min}} &= -5 & Y_{\text{min}} &= -10 \\
X_{\text{max}} &= 5 & Y_{\text{max}} &= 10 \\
X_{\text{scl}} &= 1 & Y_{\text{scl}} &= 2
\end{align*}
\]

\( \text{G-Func } : Y = y1 \text{MAX}^2 - 3, [A] = \)  

\( \text{SEL DEL} \)  

\( \text{DRAW} \) 

\( \text{F4} \)  

The function that is input using the above syntax can have only one variable.

- You cannot use X, Y or T as the variable name.
- You cannot assign a variable to the variable in the function.
- When the set-up screen’s Simul-G item is set to “On,” the graphs for all the variables are drawn simultaneously.
★ Zoom

The zoom feature lets you enlarge and reduce a graph on the display.

● Before using zoom

Immediately after drawing a graph, press \( \text{SHIFT F2} \) (ZOOM) to display the Zoom Menu.

\( \text{SHIFT F2} \) (ZOOM)

\( \begin{array}{|c|c|c|c|}
\hline
\text{BOX} & \text{FACT} & \text{IN} & \text{OUT} \\
\hline
\text{F1} & \text{F2} & \text{F3} & \text{F4} \\
\hline
\end{array} \)

\( \text{F1} \) (BOX) ....... Graph enlargement using box zoom  
\( \text{F2} \) (FACT) .... Displays screen for specification of zoom factors  
\( \text{F3} \) (IN) ........ Enlarges graph using zoom factors  
\( \text{F4} \) (OUT) .... Reduces graph using zoom factors

\( \Rightarrow \)

\( \text{F1} \) (ORIG) ..... Original size

Press \( \Rightarrow \) to return to the previous menu

● To use box zoom

With box zoom, you draw a box on the display to specify a portion of the graph, and then enlarge the contents of the box.

**Example**

To use box zoom to enlarge a portion of the graph \( y = (x + 5) \) \( (x + 4) \) \( (x + 3) \)

Use the following View Window parameters.

\[
\begin{align*}
\text{Xmin} & = -8 & \text{Ymin} & = -4 \\
\text{Xmax} & = 8 & \text{Ymax} & = 2 \\
\text{Xscl} & = 2 & \text{Yscl} & = 1 \\
\end{align*}
\]

1. After graphing the function, press \( \text{SHIFT F2} \) (ZOOM).
2. Press **F1** (BOX), and then use the cursor keys (←, →, ↑, ↓) to move the pointer to the location of one of the corners of the box you want to draw on the screen. Press **EX** to specify the location of the corner.

```
F1 (BOX)
← ~ → EX
```

3. Use the cursor keys to move the pointer to the location of the corner that is diagonally across from the first corner.

```
↑ ~ ↓ ← ~ →
```

4. Press **EX** to specify the location of the second corner. When you do, the part of the graph inside the box is immediately enlarged so it fills the entire screen.

```
EX
```

- To return to the original graph, press **F2** (ZOOM) → **F1** (ORIG).
- Nothing happens if you try to locate the second corner at the same location or directly above the first corner.
- You can use box zoom for any type of graph.

**To use factor zoom**

With factor zoom, you can zoom in or zoom out on the display, with the current pointer location being at the center of the new display.

- Use the cursor keys (←, →, ↑, ↓) to move the pointer around the display.

**Example**

Graph the two functions below, and enlarge them five times in order to determine whether or not they are tangential:

Y1: \( y = (x + 4)(x + 1)(x - 3) \)
Y2: \( y = 3x + 22 \)
Use the following View Window parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Xmin</td>
<td>-8</td>
</tr>
<tr>
<td>Ymin</td>
<td>-30</td>
</tr>
<tr>
<td>Xmax</td>
<td>8</td>
</tr>
<tr>
<td>Ymax</td>
<td>30</td>
</tr>
<tr>
<td>Xscl</td>
<td>5</td>
</tr>
<tr>
<td>Yscl</td>
<td>10</td>
</tr>
</tbody>
</table>

1. After graphing the functions, press \( \text{SHIFT} \text{F2} \) (ZOOM), and the pointer appears on the screen.

![SHIFT F2 (ZOOM)](image)

2. Use the cursor keys (\( \text{\textless} \), \( \text{\textgreater} \), \( \text{\textuparrow} \), \( \text{\textdownarrow} \)) to move the pointer to the location that you want to be the center of the new display.

![Cursor Keys](image)

3. Press \( \text{F2} \) (FACT) to display the factor specification screen, and input the factor for the \( x \)- and \( y \)-axes.

![Factor Specification](image)

4. Press \( \text{OUT} \) to return to the graphs, and then press \( \text{F3} \) (IN) to enlarge them.

![Enlarged Screen](image)

This enlarged screen makes it clear that the graphs of the two expressions are not tangential.

- Note that the above procedure can also be used to reduce the size of a graph (zoom out). In step 4, press \( \text{F4} \) (OUT).
• The above procedure automatically converts the $x$-range and $y$-range View Window values to 1/5 of their original settings.

• You can repeat the factor zoom procedure more than once to further enlarge or reduce the graph.

**To initialize the zoom factor**

Press \( \text{SHIFT} \ F2 \) (ZOOM) \( F2 \) (FACT) \( F1 \) (INIT) to initialize the zoom factor to the following settings.

\[ X_{fct} = 2 \quad Y_{fct} = 2 \]

• You can use the following syntax to incorporate a factor zoom operation into a program.

\[ \text{Factor \langle X \_factor\rangle, \langle Y \_factor\rangle} \]

• You can use factor zoom for any type of graph.

**Sketch Function**

The sketch function lets you draw lines and graphs on an existing graph.

• Note that Sketch function operation in the STAT, GRAPH or TABLE Mode is different from Sketch function operation in the RUN or PRGM Mode.

**Before using the Sketch Function**

Press \( \text{SHIFT} \ F4 \) (SKTCH) to display the sketch menu.

**In the STAT, GRAPH or TABLE Mode**

\[ \text{SHIFT} \ F4 \] (SKTCH)

- \( F1 \) (Cls) \ldots \ldots \text{Clears drawn line and point}
- \( F3 \) (Plot) \ldots \ldots \text{Displays plot menu}
- \( F4 \) (Line) \ldots \ldots \text{Displays line menu}

Press \( \text{Up} \) to return to the previous menu

**In the RUN or PRGM Mode**

\[ \text{SHIFT} \ F4 \] (SKTCH)

- \( F1 \) (Vert) \ldots \ldots \text{Vertical line}
- \( F2 \) (Hztl) \ldots \ldots \text{Horizontal line}

Press \( \text{Up} \) to return to the previous menu
• Other menu items are identical to those in the STAT, GRAPH, TABLE Mode menu.

The Sketch function lets you draw lines and plot points on a graph that is already on the screen.

All the examples in this section that show operations in the STAT, GRAPH or TABLE Mode are based on the assumption that the following function has already been graphed in the GRAPH Mode.

Memory Area Y1: \( y = x(x + 2)(x - 2) \)

The following are the View Window parameters used when drawing the graph.

\[
\begin{align*}
X_{\text{min}} &= -5 \\
Y_{\text{min}} &= -5 \\
X_{\text{max}} &= 5 \\
Y_{\text{max}} &= 5 \\
X_{\text{scl}} &= 1 \\
Y_{\text{scl}} &= 1
\end{align*}
\]

To plot points

In the STAT, GRAPH or TABLE Mode

Example To plot a point on the graph of \( y = x(x + 2)(x - 2) \)

1. After graphing the function, display the sketch menu and perform the following operation to cause the pointer to appear on the graph screen.

2. Use the cursor keys (↑, ↓, ←, →) to move the pointer the locations of the points you want to plot and press EXE to plot.

• You can plot as many points as you want.

• The current \( x \)- and \( y \)-coordinate values are assigned respectively to variables \( X \) and \( Y \).
Graphing Chapter 4

In the RUN or PRGM Mode

The following is the syntax for plotting points in these modes.

Plot \( \langle x\text{-coordinate}, y\text{-coordinate} \rangle \)

**Example**

To plot a point at (2, 2)

Use the following View Window parameters.

\[
\begin{align*}
X_{\text{min}} &= -5 & Y_{\text{min}} &= -10 \\
X_{\text{max}} &= 5 & Y_{\text{max}} &= 10 \\
X_{\text{scl}} &= 1 & Y_{\text{scl}} &= 2
\end{align*}
\]

1. After entering the RUN Mode, display the sketch menu and perform the following operation.

   ![Sketch Menu](image)

   **SHIFT**  F4 (SKTCH)  F1 (Cls)  EXE

   F3 (Plot)  2  *  2

2. Press **EXE**.

   ![Graph Screen](image)

   **EXE**  **EXE**

   - You can use the cursor keys (↑, ↓, ←, →) to move the pointer around the screen.

   - If you do not specify coordinates, the pointer is located in the center of the graph screen when it appears on the display.

   - If the coordinates you specify are outside the range of the View Window parameters, the pointer will not be on the graph screen when it appears on the display.

   - The current \( x\)- and \( y\)-coordinate values are assigned respectively to variables \( X \) and \( Y \).
To draw a line between two plotted points

In the STAT, GRAPH or TABLE Mode

Example
To draw a line between the two points of inflection on the graph of \( y = x(x + 2)(x - 2) \)
Use the same View Window parameters as in the example on page 66.

1. After graphing the function, display the sketch menu and perform the following operation to cause the pointer to appear on the graph screen.

   \[
   \text{SHIFT} \quad \text{F4 (SKTCH)} \quad \text{F3 (Plot)}
   \]

2. Use the cursor keys (↑, ↓, ←, →) to move the pointer to one of the points of inflection and press \( \text{EX} \) to plot it.

3. Use the cursor keys to move the pointer to the other point of inflection.

4. Display the sketch menu and perform the following operation to draw a line between the two points.

   \[
   \text{SHIFT} \quad \text{F4 (SKTCH)} \quad \text{F4 (Line)}
   \]
In the RUN or PRGM Mode

Example To draw a line perpendicular to the x-axis from point \((x, y) = (2, 6)\) on the graph \(y = 3x\)

Use the following View Window parameters:
\[
\begin{align*}
X_{\text{min}} &= -2 & Y_{\text{min}} &= -2 \\
X_{\text{max}} &= 5 & Y_{\text{max}} &= 10 \\
X_{\text{scl}} &= 1 & Y_{\text{scl}} &= 2
\end{align*}
\]

1. After drawing the graph, use the procedure under “To plot points” to move the pointer to \((x, y) = (2, 0)\), then use the cursor key (\(\uparrow\)) to move the pointer on the graph \(y = 3x\).

2. Display the sketch menu and perform the following operation to draw a straight line between the two points.

- The above draws a straight line between the current pointer location and the previous pointer location.

To draw vertical and horizontal lines

The procedures presented here draw vertical and horizontal lines that pass through a specific coordinate.

In the STAT, GRAPH or TABLE Mode

Example To draw a vertical line on the graph of \(y = x(x + 2)(x - 2)\)

1. After graphing the function, display the sketch menu and perform the following operation to display the pointer and draw a vertical line through its current location.
2. Use the ◄ and ► cursor keys to move the line left and right, and press EXE to draw the line at the current location.

To draw a horizontal line, simply press F2 (Hztl) in place of F1 (Vert), and use the ◄ and ► cursor keys to move the horizontal line on the display.

**In the RUN or PRGM Mode**
The following is the syntax for drawing vertical and horizontal lines in these modes.

- **To draw a vertical line**
  
  Vertical <x-coordinate>

- **To draw a horizontal line**
  
  Horizontal <y-coordinate>

**To clear drawn lines and points**
The following operation clears all drawn lines and points from the screen.

**In the STAT, GRAPH or TABLE Mode**
Lines and points drawn using sketch menu functions are temporary. Display the sketch menu and press F1 (Cls) to clear drawn lines and points, leaving only the original graph.

**In the RUN or PRGM Mode**
The following is the syntax for clearing drawn lines and points, as well as the graph itself.

Cls EXE
