## Overview

### 1 Product Configuration as a MIDI Device

As a MIDI device, this Instrument consists of the System Section, Sound Generator Section, and Performance Controller Section described below. Each of these sections can send and receive specific MIDI Messages in accordance with its function.

#### 1.1 System Section

The System Section manages the Instrument status and user data.

#### 1.2 Performance Controller Section

The Performance Controller Section performs keyboard play and controller operations, and generates performance messages. Basically, generated performance messages are sent to external destinations while also being transmitted to the Sound Generator Section. The channel number of the sent channel message is in accordance with the Instrument's MIDI setting. For details about the MIDI setting, see the Instrument's User's Guide.

#### 1.3 Sound Generator Section

The Sound Generator Section mainly performs receive of performance information and sound source setting information. It consists of a common part that does not depend on the channel and a musical instrument part that is independent of each channel.

##### 1.3.1 Sound Generator Common Block

The common block consists of system effects, master control, etc. These can be controlled by effect function, or general universal system exclusive messages.

##### 1.3.2 Instrument Part Block

The instrument part section is divided into A, B, C group for every 16 parts, and it consists of a total of 48 parts. The settings of each part can be changed using channel messages. Of these, only the C group can be controlled by external channel messages.

The functions assigned to each part are shown below.

## 2 Timbre Type Specific Operation

The sound source operation performed for a sound generator instrument receive message may depend on the value of the Timbre Type (see “About the Timbre Type” in “8 Program Change”) of each part’s operation mode. For details, see the explanation for each message.

## 3 Controlling Send/Receive of MIDI Messages in Each Instrument Part

Send and receive of MIDI messages for each instrument part can be controlled by global Instrument MIDI settings and Instrument-specific system exclusive messages. See the Instrument’s User’s Guide for details.

## 4 Conditions that Disable Message Send and Receive

No MIDI messages at all can be sent or received while the instrument starts up, shuts down, “Welcome”, “Bye”, and “Wait” is on the display, etc.

## Part II

# Channel Message

**Instrument Velocity Resolution** The upper seven bits of the 14-bit resolution correspond to the Note On/Off message, while the lower seven bits correspond to the High Resolution Velocity Prefix message.

The initial default value for the lower 7 bits is 00H. Receipt of a High Resolution Prefix message causes the lower seven bits to be set, but note on is not performed.

Receipt of a Note On message causes the upper seven bits to be set with note on performed with 14-bit resolution Velocity.

The High Resolution Velocity Prefix message corresponds the message immediately following the Note On/Off message, and the lower seven bits are cleared to 00H immediately following note on by the Note On/Off message. 7-bit resolution note on using only the Note On/Off message also continues to be supported.

For details about each message, see "5 Note Off", "6 Note On" and "7.20 High Resolution Velocity Prefix".

## 5 Note Off

### Format

Message Format: 8nH kkH vvH  
9nH kkH 00H(receive only)

n: MIDI Channel Number

kk: Key Number

vv: Velocity

**Transmit** Sent when something is played on the keyboard or when play is performed using the Arpeggiator, etc. The key number changes in accordance with on the Transpose function and Octave Shift function.

**Receive** Receipt stops a note being sounded by a note on message.

When a High Resolution Velocity Prefix message is received immediately prior to the Note Off message and the lower seven bits of the 14-bit Velocity are set, the 14-bit resolution note off is performed.

For information about the relationship between the Note Off message and High Resolution Velocity Prefix message, see "Instrument Velocity Resolution" at the beginning of part II.

## 6 Note On

Message Format: 9nH kkH vvH

---

**About the Timbre Type** Tones that are selected by each Instrument part have an attribute that depends on the sound source operation type. This attribute is called the “timbre type,” which is one of the types described below.

- Melody

This timbre type optimizes for normal melody tones. The damper pedal performs on/off operations.

- Piano

This Timbre Type is for piano tones. The decay rate of the voice being sounded is seamlessly altered in accordance with the depressed amount of damper pedal. The method for producing sound in response to the note messages also is different from that of the melody Timbre Type, and operation is optimized for piano.

- LMPiano

This Timbre Type is for Linear Morphing piano tones. The decay rate of the voice being sounded and Damper Resonance effect characteristics are seamlessly altered in accordance with the depressed amount of damper pedal. The method for producing sound in response to the note messages also is different from that of the melody Timbre Type, and operation is optimized for piano.

- Drum

This setting optimizes for drum sounds. The damper pedal does not function. The Damper Pedal (Sustain), Channel Coarse Tune, and Master Coarse Tune messages are ignored if they are received.

## 9 Channel Pressure (Aftertouch)

Message Format: DnH vvH

---

n: MIDI Channel Number  
vv: Value

**Receive** Receipt adds, to the tone being sounded, modulation of a depth specified by the value. In the case of a tone that already has modulation applied, receipt of this message increases the modulation depth. The modulation effect differs according to the tone being used.

## 10 Pitch Bend

Message Format: EnH llH mmH

---

n: MIDI Channel Number  
ll: Value LSB  
mm: Value MSB

**Transmit** Sent when the pitch bend wheel is operated.

**Receive** Receipt changes the pitch of the currently sounding note. The range of the pitch change depends on the Pitch Bend Range value setting.

## Part III

# System Message

## 11 Active Sensing

Message Format: FEH

**Receive** Once this message is received, the Active Sensing mode is entered. If no MIDI message is received for a specified amount of time, voices being sounded by this Instrument's sound source are released, the controller is reset, and the Active Sensing mode is exited.

## Part V

# MIDI Implementation Notation

## 14 Value Notation

### 14.1 Hexadecimal Notation

MIDI implementation sometimes requires that data be expressed in hexadecimal format. Hexadecimal values are indicated by the letter “H” after the value. The hexadecimal equivalents of decimal values 10 through 15 are expressed as the letters A through F.

The table below shows the hexadecimal equivalents for decimal values 0 through 127, which are often used in MIDI messages.

Decimal	Hexadecimal	Decimal	Hexadecimal	Decimal	Hexadecimal	Decimal	Hexadecimal
0	00H	32	20H	64	40H	96	60H
1	01H	33	21H	65	41H	97	61H
